

DISRUPTORS MEDIA · FIELD GUIDE

An SEO team in *one* *command.*

A playbook for Claude SEO — the open-source Claude Code skill that fans out 25 sub-skills and 18 specialist agents across any website and hands back a prioritized, falsifiable action plan. Install steps, the commands that matter, and the audit workflow that replaces a 1–3 week agency engagement.

\$0

MIT-LICENSED · RUNS LOCAL

10–15 min

FULL SITE AUDIT TIME

27

COMMANDS · 25 SUB-SKILLS
· 18 AGENTS

SECTION 01

One command. A full SEO team.

Most SEO work is the same audit, repeated by hand, over a few weeks. Claude SEO compresses that into a single command — parallel agents covering technical, content, schema, AI search, local, e-commerce, and international — converging into one prioritized plan.

The repo

Claude SEO is an open-source plugin for Claude Code. You don't wire up the agents or decide which checks to run. Point it at a URL — it spins up specialists across technical SEO, content quality (E-E-A-T), Schema.org, AI search (GEO), local, e-commerce, and international SEO, then merges everything into one prioritized plan. Every recommendation comes with a "how would we know this failed?" check, so nothing is hand-wavy.

github.com/AgriciDaniel/claude-seo

MIT licensed. 271 tests passing. Active, production-grade open source.

Local-first by design

No data leaves your machine unless you opt into an enrichment API. No per-domain pricing.

What it replaces

OLD WAY	CLAUDE SEO
\$1.5–10K agency audit Stretched over 1–3 weeks of back-and-forth.	One command, 10–15 minutes Same depth, generated on demand from your laptop.
Stitched-together SaaS stack Ahrefs + Screaming Frog + Schema validator + GSC.	One orchestrator, 18 specialists Tech, content, schema, GEO, local, backlinks — unified.
Hand-wavy recommendations "Improve E-E-A-T." Cool. How?	Falsifiable fixes Every rec ships with a failure check and a leading indicator.

THE PROMISE

Install in 2 minutes. Point it at any URL. Get the same audit a senior SEO would produce after a week — ranked by impact, sequenced by dependency, and ready to hand to a developer.

SECTION 02

Install in two minutes.

Three install paths. Pick the one that matches your machine. No API keys required to start — everything runs locally on first launch.

1

Plugin install — fastest

CLAUDE CODE 1.0.33+ • ~30 SECONDS

If you're on a recent Claude Code build, install directly from the plugin marketplace inside the Claude Code session.

```
/plugin marketplace add AgriciDaniel/claude-seo  
/plugin install claude-seo@agricidaniel-claude-seo
```

2

Manual install — macOS / Linux

CLONE & RUN • ~90 SECONDS

Clone the repo and run the install script. Works on any modern macOS or Linux machine with Python 3.10+.

```
git clone --depth 1 https://github.com/AgriciDaniel/claude-seo.git  
bash claude-seo/install.sh
```

3

Manual install — Windows

POWERSHELL • ~90 SECONDS

Same flow, PowerShell variant. The execution policy bypass is scoped to this single script run.

```
git clone --depth 1 https://github.com/AgriciDaniel/claude-seo.git  
powershell -ExecutionPolicy Bypass -File claude-seo\install.ps1
```

Requirements

- Python 3.10+ and the Claude Code CLI — both required.
- Playwright Chromium — auto-installed; used for JS-rendered / SPA crawls.
- Optional: Google API credentials for live CWV, Search Console, and GA4 data — run `/seo google setup` when you're ready.

SECTION 03

Run your first audit.

Two commands. Ten minutes. A full `FULL-AUDIT-REPORT.md` with a 0–100 score, your critical issues ranked, and every fix tagged with the observation it rests on plus the leading indicator to watch.

1

Open Claude Code

TERMINAL • 1 LINE

```
claude
```

2

Fan out the full audit

PARALLEL AGENTS • 10–15 MINUTES

Point Claude SEO at the URL. Specialist agents spin up in parallel, each owning a slice of the audit, then converge into a single prioritized report.

```
/seo audit https://your-site.com
```

Then go deeper on what the audit flagged

The audit surfaces the priorities. These commands drill into each one with a focused specialist agent.

```
# Deep single-page analysis: on-page, content quality, schema
/seo page https://your-site.com/about

# Detect, validate, and generate Schema.org markup
/seo schema https://your-site.com

# AI search readiness – AI Overviews / GEO, passage citability
/seo geo https://your-site.com

# Technical SEO across 9 categories – CWV, crawlability, indexation
/seo technical https://your-site.com

# Strategic plan tuned to your business type
/seo plan saas      # or: local • ecommerce • publisher • agency
```

WHAT YOU GET BACK

A `FULL-AUDIT-REPORT.md` file with a 0–100 site score, every critical issue ranked, and a dependency-ordered action plan. Each recommendation carries a failure check and a leading indicator — falsifiable, not promotional.

SECTION 04

The commands worth knowing.

Eleven daily-driver commands. Full reference: 27 commands total across the orchestrator and 25 sub-skills. These are the ones you'll actually use.

COMMAND	WHAT IT DOES
<code>/seo audit <url></code> START HERE	Full site audit. Parallel agents. Prioritized action plan.
<code>/seo page <url></code>	Deep single-page analysis — on-page, content quality, schema.
<code>/seo technical <url></code>	Technical SEO across nine categories — CWV, crawlability, indexation.
<code>/seo content <url></code>	E-E-A-T evaluation and content quality scoring.
<code>/seo schema <url></code>	Detect, validate, and generate Schema.org markup.
<code>/seo geo <url></code>	AI Overviews / Generative Engine Optimization readiness.
<code>/seo local <url></code>	Local SEO — Google Business Profile, citations, reviews, map pack.
<code>/seo backlinks <url></code>	Backlink profile analysis.
<code>/seo cluster <keyword></code>	SERP-based semantic keyword clustering.
<code>/seo plan <type></code>	Strategic plan — saas, local, ecommerce, publisher, or agency.
<code>/seo sitemap generate</code>	Generate an XML sitemap from templates.

WORKFLOW

Audit first. Let `/seo audit` tell you what's broken. Then use the focused commands to fix the top three. Re-run the audit to confirm the score moved. Repeat weekly.

SECTION 05

How it actually works. Why it's different.

You run one command. Under the hood, three stages do the heavy lifting — industry detection, parallel dispatch, and synthesis.

01 • DETECT

Industry detection

Identifies whether you're SaaS, local, e-commerce, publisher, or agency — and tunes the audit to the playbook that matters.

02 • DISPATCH

Parallel agents

Spins up to 15 specialist agents at once. Each owns a slice — technical, content, schema, GEO, local — and runs independently.

03 • SYNTHESIZE

Prioritized plan

Collects every finding, scores them through a 10-principle framework, and sequences them into a dependency-ordered action plan.

Why it's different from every other SEO tool

AI-SEARCH FIRST

Aligned with Google's AI Optimization Guide. Scores passage citability and entity presence — not last year's checklist.

FALSIFIABLE

Every recommendation ships with an explicit failure check and a leading indicator. No vibes-based advice.

LOCAL BY DEFAULT

No data leaves your machine unless you opt into an enrichment API. No per-domain pricing, no lock-in.

The bigger play

This is what a "full team in a skill" actually looks like. An orchestrator, 25 sub-skills, 18 specialists, and a synthesis layer — all generated for one domain. The same architecture applies to anything your business does repeatedly. SEO today. Outbound, support triage, content production tomorrow.

THE TAKEAWAY

The agencies billing \$1.5–10K per audit are about to be undercut by anyone with a laptop and ten minutes. Run the audit. Ship the fixes. Re-run weekly. That's the new floor.
