

THE ESSENTIAL SLASH COMMANDS

Twenty commands that make Claude Code *actually fast*.

The slash commands seasoned operators reach for daily — pulled from real Claude Code users shipping production work. Keep this open in a second monitor. Type the slash, type the command, ship.

/clear

Wipes the conversation and frees the context window for a fresh task.

/compact

Summarizes the current session in place so you can keep going without losing the thread.

/init

Generates a CLAUDE.md so Claude understands your repo's conventions on every run.

/model

Swaps between Opus, Sonnet, and Haiku mid-session to match cost and capability.

/agents

View, edit, and spin up specialized sub-agents that handle scoped tasks in parallel.

/mcp

Connect Model Context Protocol servers — databases, Slack, Notion, anything with an MCP.

/memory

Open and edit the persistent memory files Claude carries between sessions.

/review

Runs a structured code review on the current branch before you open the PR.

/pr-comments

Pulls down GitHub PR comments so Claude can address every reviewer note in one pass.

/security-review

Audits pending changes for credential leaks, injection risk, and common vulnerabilities.

/hooks

Wire shell hooks that fire on tool calls — auto-format, lint, or block dangerous actions.

/permissions

Allowlist or deny specific tools and paths so Claude stops asking for the same approval.

/cost

Shows tokens spent and dollar cost for the current session in real time.

/resume

Reopens a previous session from history exactly where you left off.

/export

Saves the full transcript to a file — perfect for handoffs and audit trails.

/todos

Surfaces Claude's live task list so you can see exactly what's planned and what's done.

/status

Reports account, active model, working directory, and current permission mode.

/add-dir

Grants Claude access to an additional directory outside the launch folder.

/ide

Connects to VS Code or JetBrains for inline diffs, jump-to, and selection context.

/help

Lists every available slash command, including ones added by your installed plugins.

PRO TIP Pair **/init** on day one with **/compact** before context fills up, and **/clear** at every new task. That single rhythm is the difference between Claude as a toy and Claude as an operator.
